Tawazi AI

Delivery Approach

Fadaat AI Native Development Framework

AI-assisted product delivery, connected end to end on the Atlassian stack.

October 2026

AI is writing our code.
But code is only a third of the work.

FROM IDEA TO LAUNCH

The other two-thirds of the journey is where most organizations **aren’t using AI yet.**

Source: Bain & Company, Technology Report 2025 · share of time from initial idea to product launch

The gap is the opportunity

AI ON CODING ONLY

+10–15%

productivity gain

Code gets faster, but requirements, design, reviews and release still move at the old pace.

AI ACROSS THE WHOLE LIFECYCLE

+30%

productivity gain

AI paired with end-to-end process change, from the first requirement to release.

That gap is where Tawazi works.

Source: Bain & Company, Technology Report 2025

AI tools alone won’t transform delivery.

Our operating model must evolve.

Tawazi connects people, AI agents and governance—so delivery can scale without losing quality or control.

Before

Fragmented delivery

- Manual coordination and handoffs
- Context scattered across tools
- Late quality checks, limited visibility

WITH TAWAZI

Connected execution

- Agents and teams working together
- Shared context across delivery
- Continuous quality, measurable impact

Why Tawazi? The Cost of Traditional Software Delivery

"AI can accelerate every stage of software development. So why are we still losing time between them?"

68%

Saving time with AI

68 out of every 100 developers surveyed reported saving more than 10 hours per week using AI.

Atlassian Developer Experience Report, 2025

Inside Atlassian

50%

Losing time to inefficiencies

50 out of every 100 developers reported losing at least 10 hours per week to non-coding tasks and organizational friction.

Same Atlassian survey, 3,500 respondents

Inside Atlassian

AI is creating task-level efficiencies, but workflow friction remains.

Evidence Across the Delivery Lifecycle

PRDs & product documentation

116 → 70 min

~40%

less time on a set of content-heavy PM tasks, including PRDs and backlogs.

McKinsey, 2024
McKinsey & Company

User story creation

45 → 12 min

~73%

less time per story in one enterprise BA-agent case study.

Art of BA, enterprise
ArtofBA

UX design & prototyping

faster

20%

AI-assisted design task completion, measured in a 100-person controlled study.

Figma, 2026
Figma Blog

Development

2h 41m → 1h 11m

~55%

faster on a defined coding task using GitHub Copilot.

GitHub Research
The GitHub Blog

QA test-case generation

less time

Average drafting-time reduction in a small experiment involving nine user stories; human validation remained necessary.

TAWAZI

From isolated AI productivity to an intelligent delivery system.

Connecting requirements, planning, design, development, QA, and release through orchestrated AI agents, governance, and measurable outcomes.

AI is changing software delivery across the entire lifecycle

Not just generating code, but supporting multidisciplinary teams and optimizing every step, from ideation to deployment.

30%

faster time-to-market

AI Across the Product Life Cycle

Quality built in early

05

Deployment

Faster release to production

Validate hypotheses in production

Why the Whole Life Cycle, and What It Takes

WHY

- Removes silos and ticket passing between teams
- First-time-right delivery, from onboarding to deployment
- Better quality and faster products
- Supports people; it does not replace them

WHAT IT TAKES

- An ecosystem of trained AI agents
- Multidisciplinary teams working with the agents
- Connected tools and shared context
- Human oversight and measurable KPIs

Two Delivery Approaches

Accelerated

18 sequential stages across six roles, from product definition to Staging QA.

Turbo

Confluence, Jira and Bitbucket linked from PRD to STG and PROD, with status driven by pull requests.

View full workflow

02 · Accelerated

Accelerated Workflow & Agents

12 agents

6 roles

01 Product Manager

- PRD Creator Agent
- PRD Checker Agent
- User Stories Creator Agent
- Design Promoter Agent

Output
Validated PRD, user stories & design prompt

02 Designer

- MCP to Figma

Output
Figma designs

03 Project Manager

04 DevOps

- CI/CD flow and .MD files

Output
CI/CD pipeline & documentation

05 Developers

- Jira Analyzer Agent
- Frontend & Backend Engineering Agent
- Code & Security Review Agent
- SEO Technical Agent
- Load / Stress Test Agent

Output
Reviewed, tested code in PRs

06 QA

- Playwright Agent

Output
Staging QA sign-off

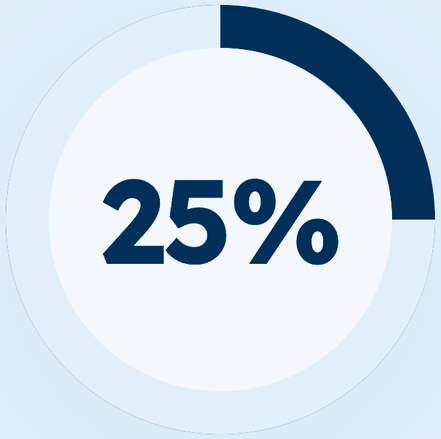

Accelerated KPIs

30%

Time to Market

Faster vs. current baseline

25%

Number of Developers

Less per product delivery

40%

Defects

Fewer after Staging QA vs. baseline

The Turbo Stack

01

Confluence

02

Jira

03

AI Development

AI agents

04

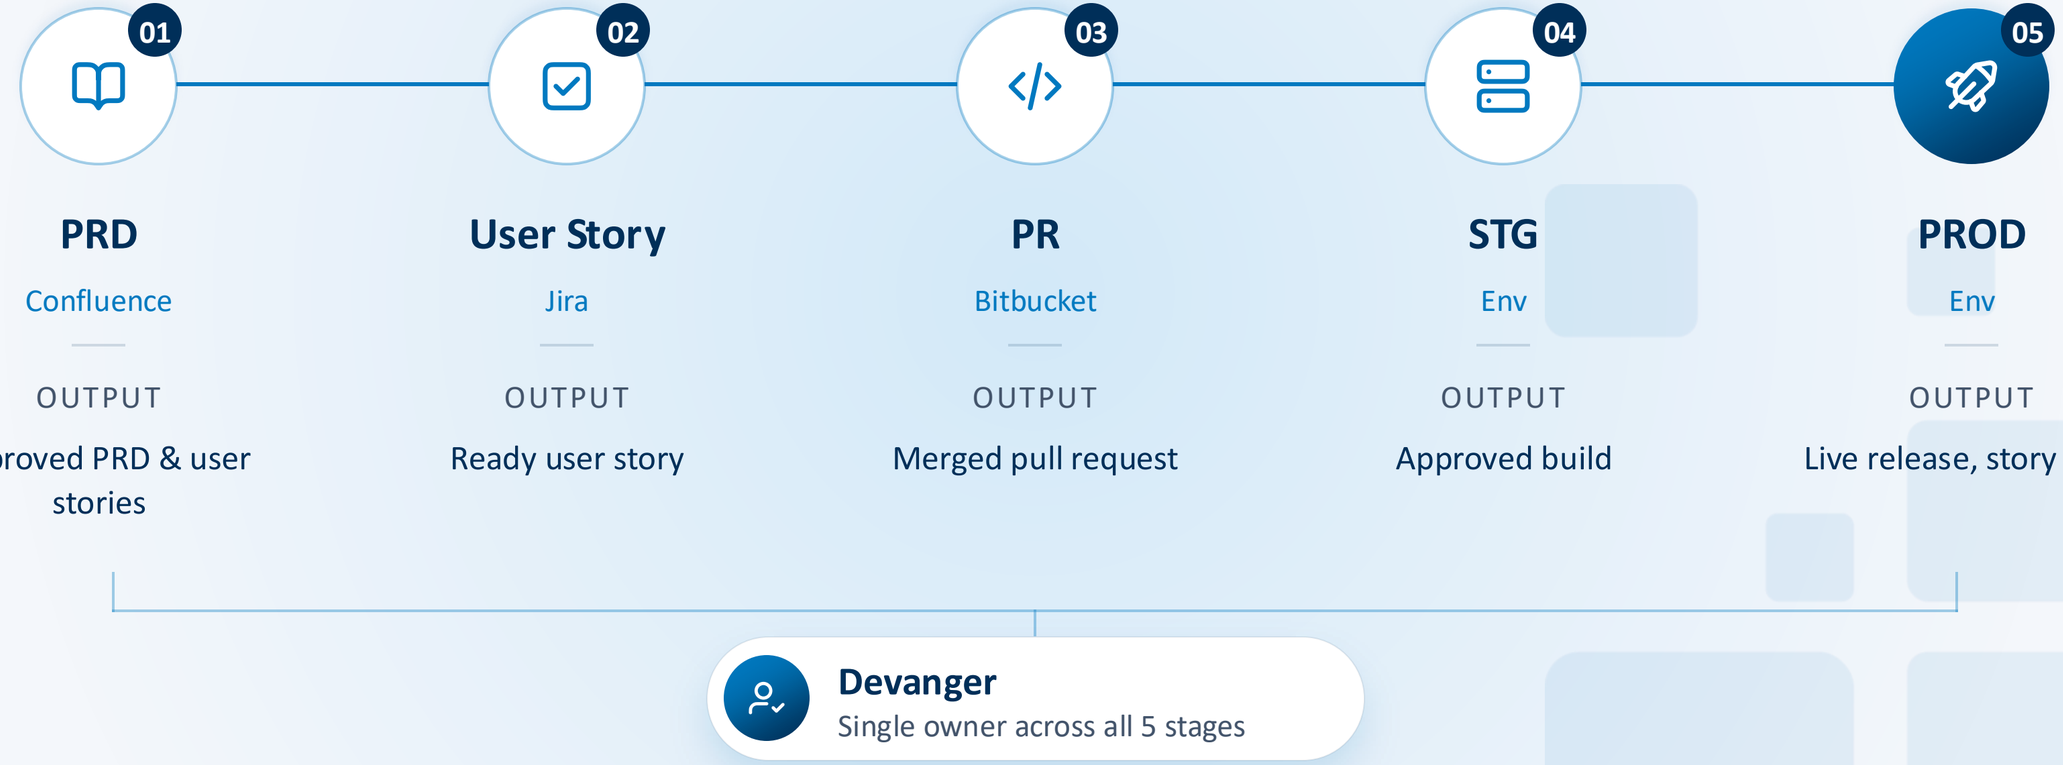

Bitbucket

05

Environments

Turbo Pipeline: PRD to Production

5
stages

Every PR and release is linked back to its Jira user story

PR Status Drives User Story Status

Bitbucket / environment event	Jira user story status
Branch created with story key	In Progress
Pull request opened	In Review
PR merged, deployed to STG	In QA
Released to PROD	**Done**

Turbo KPIs

XX%

Time to Market

Faster vs. current baseline

XX%

Number of Developers

Per product delivery

XX%

Defects

Fewer after Staging QA vs. baseline

Accelerated vs Turbo

	Accelerated	Turbo
Ownership	6 roles, sequential handoffs	**One owner: Devanger**
Structure	18 stages, 12 AI agents	5 linked stages, PRD to PROD
Tracking	Per role output	Jira, PR-driven status
Documentation	Per role	All on the Jira user story
